

FOUNDING BUSINESS BLUEPRINT / VERSION 0.4

AKSEN LABS

From attention to action.

Agentic growth systems for businesses and creators

Creative direction: monochrome intelligence activated by green signals in a contemporary Accra business environment.

FOUNDING THESIS Aksen Labs will design and deploy AI agents that help organizations understand customers, create demand, execute workflows, and learn from results while keeping people in control of important decisions.

SECTION 00

How to use this blueprint

A living source of truth for strategy, product, brand, sales, and delivery.

This document converts the founding conversation into an operating blueprint. It is intentionally decisive where momentum matters and explicit about assumptions where customer discovery is still required.

WORKING RULE Treat this as a decision system, not a sacred document. Update it whenever evidence from customers, product usage, delivery economics, or platform changes invalidates an assumption.

What this document covers

Part	Purpose
Strategy	Company thesis, mission, positioning, principles, and defensibility
Products	Agent family, initial use cases, customer segments, and demo experiences
Brand	Name, voice, visual system, image direction, and video direction
Platform	Website experience, architecture, data model, trust, and channel strategy
Commercial	Business model, pricing hypotheses, sales motion, delivery, and partnerships
Execution	Roadmap, metrics, risks, open decisions, and the next 30 days

Current status

1. Proptis AI Concierge exists as the first working vertical concept and technical proof.
2. Neon Postgres and OpenRouter form the current prototype foundation.
3. The commercial relationship with Proptis has not yet been established; outreach remains a next action.
4. Aksen Labs is a proposed working name, not a completed legal, registry, trademark, or domain clearance.
5. Creator, marketing, and social-sales products remain hypotheses to validate with real users.

SECTION 01

Executive summary

A focused company with a broad platform underneath.

Aksen Labs is an agentic AI growth and operations company. It helps businesses and creators turn incoming attention, customer conversations, content, and internal knowledge into useful actions and measurable outcomes.

The company will begin services-first. It will sell discovery, focused pilots, implementation, and managed optimization while building reusable platform components underneath each engagement. This creates early revenue and customer learning without forcing the company to guess its way into a large software product.

STRATEGIC CHOICE Real estate is our first wedge, not our identity. Proptis demonstrates the customer-facing concierge pattern. Creator and marketing products prove that the same agent core can work across industries.

What Aksen sells

6. AI Discovery: identify high-value workflows, data requirements, risks, and a practical first pilot.
7. AI Pilots: deliver one focused, measurable agent in a controlled workflow.
8. AI Transformation: connect multiple agents, data sources, and teams across a business.
9. Managed Agent Operations: monitor quality, cost, safety, content, and performance after launch.
10. Creative Intelligence: generate and operate image, video, and content systems for brands and creators.

The flywheel

ATTENTION -> UNDERSTANDING -> ACTION -> LEARNING Every conversation, campaign, workflow, and outcome improves the customer experience and strengthens our reusable agent patterns.

Near-term objective

Win the first paying pilot, turn it into credible proof, and use the same platform to launch a second demonstration in creator growth or social sales. The company should not attempt to serve every

industry at once. It should demonstrate breadth through product architecture while selling one specific outcome to one specific buyer at a time.

SECTION 02

Company identity

A name and narrative designed to travel beyond one industry.

Working company name

AKSEN LABS Pronounced AK-sen. A coined, action-oriented name designed to suggest signals becoming coordinated action. It is short, global, and not tied to real estate, marketing, or a single technology.

Naming guardrails

11. Use Aksen Labs for the company and strategic implementation practice.
12. Use Aksen as the platform and product prefix, such as Aksen Concierge and Aksen Studio.
13. Do not finalize incorporation, a public domain, or paid identity work until formal clearance is complete.
14. Avoid implying that the name has a traditional linguistic meaning; it is intentionally coined.

Core language

Element	Working language
Tagline	From attention to action.
Positioning	Agentic growth systems for businesses and creators.
One-line pitch	We build AI agents that understand customers, create demand, execute workflows, and help teams act faster.
Category	Agentic AI growth and operations company
Primary promise	Useful business outcomes, not AI theatre.

Mission

Make advanced AI practical, trusted, and commercially useful for African businesses and creators, then carry the strongest solutions into global markets.

Vision

A future where every ambitious organization can operate with an intelligent layer that understands its customers, knowledge, goals, and workflows without losing human judgment or local context.

Operating principles

15. Outcomes before novelty. A workflow must create value beyond an impressive conversation.
16. Narrow entry, expandable system. Start with one measurable problem and design for adjacent workflows.
17. Human control where consequences matter. Approvals, escalation, and auditability are product features.
18. Official channels over fragile shortcuts. Prefer supported APIs and permission-based integrations.
19. Earn the right to automate. Observe, assist, approve, and only then automate proven actions.
20. Local fluency, global quality. Understand African operating realities without limiting the ambition or design standard.

SECTION 03

Brand and visual system

Monochrome intelligence activated by green signals.

The revised identity is built around black, soft white, deep forest surfaces, and carefully controlled green. Most of the experience remains calm and monochrome. Green appears when the system understands, connects, recommends, acts, or completes something. This makes intelligence visible without creating a gaming, crypto, cybersecurity, or Matrix aesthetic.

VISUAL PRINCIPLE The interface stays quiet until something meaningful happens. Green communicates state, progress, connection, and completion rather than decoration.

Color palette

Role	Color	Hex	Use
Foundation	Carbon Black	#050806	Primary backgrounds and premium product surfaces
Action	Signal Green	#7CFF62	Primary actions, active paths, successful completion
Intelligence	Emerald	#1E8F5A	Agent state, connections, data, and system activity
Text accent	Accessible Emerald	#125F38	Labels, links, and emphasis on white or pale surfaces
Reading	Soft White	#F4F7F4	Editorial backgrounds and long-form content
Surface	Graphite Green	#111A14	Cards, navigation, and elevated dark surfaces
Support	Silver Sage	#9CA9A0	Metadata, borders, and supporting text

Typography

- 21.Primary digital type: Geist Sans for navigation, interface controls, body copy, and product UI.
- 22.Editorial accent: Instrument Serif for selected campaign phrases, pull quotes, and human moments.
- 23.System labels: IBM Plex Mono for agent activity, timestamps, tool names, and technical metadata.
- 24.Use the serif and mono faces sparingly so the overall experience remains precise and highly readable.

Color ratio

- 25.Approximately 65 percent carbon black and deep forest surfaces.

- 26. Approximately 25 percent soft white and neutral editorial space.
- 27. No more than approximately 10 percent signal green and emerald activation.
- 28. Signal green is never used for normal-sized text on white or pale-green backgrounds. Accessible Emerald #125F38 is used for those text roles and provides a contrast ratio above 7:1 on Soft White.
- 29. Amber may appear only for human approval or caution states. Soft red is reserved for errors and destructive actions.

Logo direction

Use a bold lowercase wordmark with a custom A. The A can be constructed from two converging signal paths that create a forward opening. The mark must work completely in black and white. Green becomes an optional digital behavior, such as a pulse moving through the mark, rather than a requirement for recognition. Build the final logo as vector artwork, not an AI-generated raster image.

Photography and motion

- 30. Show capable people making decisions, serving customers, creating, and collaborating.
- 31. Use authentic contemporary African environments without visual stereotypes.
- 32. Use carbon-black environments, neutral light, and restrained green system cues while preserving natural skin tones.
- 33. Keep interfaces subtle and functional. Avoid robots, glowing brains, Matrix code, and hologram overload.
- 34. Use motion to explain cause and effect: message received, context understood, action completed, result learned.

Signature signal model: one active path turns attention into a measurable learning loop.

SECTION 04

Problem and opportunity

The gap is not access to AI. The gap is turning AI into reliable work.

Businesses and creators already operate across websites, WhatsApp, social channels, email, calendars, spreadsheets, CRMs, documents, and human memory. The resulting fragmentation produces slow responses, missed leads, inconsistent content, repetitive administration, and weak visibility into what drives revenue.

Problems we are built to address

Problem	Operational symptom	Aksen response
Slow customer response	Enquiries wait for staff or disappear after hours	Concierge answers, qualifies, captures, and escalates
Scattered knowledge	Teams search messages and documents for basic answers	Knowledge agent retrieves approved, sourced context
Content bottleneck	One idea takes too long to become a campaign	Studio repurposes content through an approval workflow
Attention without conversion	Comments and messages do not become pipeline	Inbox identifies intent and routes qualified opportunities
Marketing fragmentation	Research, production, publishing, and reporting are disconnected	Campaigns coordinates the workflow and learning loop
Repetitive operations	People copy data and chase routine next steps	Operations uses tools to complete controlled actions

Why now

- 35. Language models can now combine natural conversation with structured tool use.
- 36. Cloud databases and vector search make company knowledge usable without a separate enterprise stack.
- 37. Customers increasingly expect fast, personalized service across channels.
- 38. Creators and small teams need operating leverage, not simply more content suggestions.
- 39. Businesses need partners who can connect models to real workflows, data, controls, and measurable outcomes.

OUR OPENING Aksen sits between generic AI tools and expensive enterprise transformation. We combine strategy, product design, implementation, and managed operations in one accountable relationship.

SECTION 05

Product family

A common agent core expressed through focused customer outcomes.

Product	Job	Initial proof
Aksen Concierge	Customer support, discovery, qualification, booking, and follow-up	Proptis property concierge
Aksen Studio	Turn source material into approved content and creative campaigns	Creator content-to-revenue demo
Aksen Campaigns	Plan, produce, approve, and learn from marketing campaigns	Brief-to-campaign workspace
Aksen Inbox	Convert comments, messages, and enquiries into qualified opportunities	Social-sales simulation
Aksen Operations	Use internal knowledge and tools to complete repetitive workflows	Employee knowledge and action agent
Aksen Pulse	Measure conversations, content, actions, costs, and outcomes	Cross-agent analytics layer

Shared Agent Core

40. Identity and permissions for customers, staff, workspaces, and agents.
41. Company and brand knowledge with source tracking and retrieval.
42. Conversation, session, and workflow state.
43. Structured tools for search, scheduling, CRM updates, notifications, and publishing.
44. Approval gates, escalation rules, and human handoff.
45. Model routing, cost control, quality evaluation, and fallback behavior.
46. Event logging, analytics, outcome attribution, and continuous improvement.
47. Channel adapters for web, WhatsApp, email, and supported social platforms.

Experience model

OBSERVE -> ASSIST -> APPROVE -> AUTOMATE Every new workflow starts with visibility and human review. Automation expands only after the action is reliable, permitted, and economically justified.

SECTION 06

Customers and wedges

Broad platform, disciplined go-to-market.

Primary early customers

Segment	Economic buyer	Urgent job	Best first product
Property agencies	Founder, managing director, sales lead	Capture and qualify enquiries around the clock	Concierge
Creators and experts	Creator, manager, producer	Turn source content into consistent growth and leads	Studio + Inbox
Marketing agencies	Founder, operations director	Serve more clients with consistent delivery and reporting	Campaigns + Pulse
Customer-facing SMEs	Founder, commercial lead	Respond faster and book more qualified customers	Concierge + Inbox
Growing teams	COO, operations lead	Make company knowledge useful and reduce repetitive work	Operations

Ideal customer signals

- 48. The business receives enough repeated enquiries for response quality and speed to matter.
- 49. A clear person owns the commercial or operational outcome.
- 50. The workflow has a measurable completion event such as a booking, qualified lead, approved asset, or resolved request.
- 51. The business can provide approved knowledge and access to the relevant tools.
- 52. The team is willing to review early agent behavior and improve the process.

Qualification rule

ONE BUYER, ONE PAIN, ONE MEASURABLE WORKFLOW We can demonstrate a platform with many capabilities, but every pilot proposal should be anchored to one accountable business result.

SECTION 07

The Aksen web platform

An AI showroom, sales engine, and home for live proof.

The public platform should let a visitor understand Aksen in 30 seconds, experience an agent within two minutes, and imagine a pilot inside their organization within five minutes.

Primary website architecture

- 53.Home: the promise, outcomes, featured demonstrations, trust, and primary calls to action.
- 54.Agent Lab: live and guided demonstrations with an explainable behind-the-scenes view.
- 55.Solutions: Convert, Create, and Operate as the three outcome pillars.
- 56.Industries: focused pages for property, creators, marketing teams, and customer-facing businesses.
- 57.Work: transparent concept studies, official case studies, prototypes, and experiments.
- 58.Approach: discovery, pilot, transformation, and managed optimization.
- 59.Opportunity Mapper: a personalized recommendation experience that captures qualified demand.
- 60.About and contact: founding thesis, principles, credibility, and booking flow.

Homepage narrative

Moment	Visitor should understand	Experience
Hero	Aksen turns attention into useful action	Short headline, motion workflow, Try the Agent Lab
Outcomes	The company solves commercial and operating problems	Convert, Create, Operate
Proof	The agents are more than chat interfaces	Tool activity, approvals, handoffs, and results
Demos	The platform works across industries	Proptis, Creator Growth, Social Sales, Campaigns
Trust	People stay in control	Sources, permissions, approvals, audit trail
Conversion	A practical first step is available	Opportunity Mapper or discovery booking

Agent Lab demonstration standard

- 61.Experience it: let the visitor interact or make choices.

- 62. See inside: reveal retrieved context, selected tool, approval state, and completed action.
- 63. Understand the outcome: show what changed for the customer or team.
- 64. Imagine yours: translate the workflow into two or three adjacent industries.
- 65. Convert honestly: label each experience Live, Prototype, Guided Simulation, or Concept.

Interaction and motion system

Motion is part of the explanation layer. The site should remain visually calm until a relationship, state change, or completed action needs to be communicated. Every animation must help the visitor understand how an Aksen agent moves from signal to outcome.

Signature website behavior

- 66. A thin signal-green path enters the hero as a message or idea and continues through the page as the visitor scrolls.
- 67. The path activates Attention, Understand, Decide, Act, Outcome, and Learn one stage at a time.
- 68. Product cards begin monochrome, then reveal one active green workflow on hover or focus.
- 69. Agent demonstrations show a restrained activity timeline for retrieval, tool use, approval, completion, and handoff.
- 70. Page transitions use a short green sweep or signal pulse rather than full-screen visual effects.
- 71. Buttons use a small expanding green point, subtle forward arrow movement, and stable text placement.

Page-specific explanatory diagrams

Page	Diagram	Interaction
Home	Attention-to-action signal path	Scroll activates one business stage at a time
Agent Lab	Decision trace and tool timeline	Expand any event to see context, source, tool, and outcome
Solutions	Convert, Create, Operate system map	Selecting one pillar reveals its connected agent modules
Industries	Before-and-after workflow	Drag or toggle between fragmented work and the coordinated agent flow
Work	Opportunity-to-outcome case map	Reveal challenge, intervention, human controls, and evidence
Opportunity Mapper	Personalized agent architecture	Answers progressively assemble a recommended workflow
Trust	Human-control ladder	Risk level changes the required approval and escalation behavior

Dark and light rhythm

- 72. Use dark sections for the hero, Agent Lab, product mechanics, architecture, and closing call to action.
- 73. Use soft-white sections for explanations, industries, case studies, trust, and long-form reading.

- 74. Move between dark product moments and light editorial moments to avoid an endless dashboard appearance.
- 75. Reserve full signal green for active controls, live paths, selected states, and confirmed outcomes.

Animation guardrails

- 76. Most micro-transitions should complete between approximately 180 and 450 milliseconds.
- 77. Longer scroll sequences are acceptable only when they explain a multi-stage workflow.
- 78. Do not hijack scrolling, move body text while it is being read, or animate elements without a communication purpose.
- 79. Pause off-screen animations and respect the user's reduced-motion preference.
- 80. Design mobile alternatives that preserve meaning without depending on hover behavior.
- 81. Target smooth performance on ordinary mobile devices before adding decorative complexity.

Recommended implementation

- 82. Framer Motion for component transitions, shared layout movement, and accessible interface states.
- 83. GSAP only for sophisticated scroll-linked signal diagrams where CSS and Framer Motion are insufficient.
- 84. SVG for workflow lines, nodes, architectural maps, and responsive explanatory diagrams.
- 85. CSS transforms and opacity for simple high-performance micro-interactions.
- 86. Rive or Lottie only for contained reusable brand motion with a clear role.
- 87. Avoid Three.js until a specific three-dimensional experience materially improves understanding.

SECTION 08

Initial demonstration catalog

Four stories that prove one reusable platform.

Demo 1: Proptis AI Concierge

A conversational property assistant that answers common questions, discovers requirements, recommends suitable properties, qualifies a buyer or renter, captures a lead, and prepares a viewing request. The interface should expose selected tool activity without overwhelming the user.

Demo 2: Creator Growth Agent

A creator provides a video, transcript, newsletter, or voice note. The system extracts themes, proposes platform-native ideas, drafts assets in the creator's voice, routes them for approval, and connects high-intent engagement to a lead or offer.

Demo 3: Social Sales Agent

A guided social-feed simulation shows a comment becoming a useful conversation, a qualified opportunity, a booked call, and a CRM record. This should emphasize permission, tone, escalation, and measurable conversion rather than mass messaging.

Demo 4: Marketing Campaign Agent

A visitor completes a short campaign brief. The agent creates a research summary, positioning options, campaign angles, creative briefs, an approval plan, channel adaptations, and a measurement framework.

Required demo metadata

Field	Purpose
Status	Live, Prototype, Guided Simulation, or Concept
Problem	The customer pain being addressed
Agent actions	What the agent actually understands or completes
Human controls	Approval, escalation, and override points
Integrations	Current connections and illustrative future connections
Outcome	The measurable event the workflow is designed to improve

SECTION 09

Creator and social growth opportunity

Build a Creator Chief of Staff, not another caption generator.

Image-generation example: a creator campaign visual showing one source moment becoming a coordinated content system.

Recommended first wedge

CONTENT-TO-REVENUE AGENT Turn one long-form video, podcast, newsletter, or voice note into an approved weekly campaign, then help identify and route high-intent engagement into a measurable next step.

First version capabilities

- 88. Ingest creator-owned source material and previous approved content.
- 89. Build a brand voice profile with explicit do and do-not guidance.
- 90. Extract themes, stories, hooks, teachable moments, and content opportunities.
- 91. Draft channel-specific assets without pretending one caption fits every platform.
- 92. Route drafts through creator or manager approval.

- 93. Prepare publishing packages through supported platform integrations.
- 94. Track content performance and connect it to leads, bookings, or offers where possible.
- 95. Organize sponsorship enquiries, deliverables, approvals, and deadlines.

Defensible difference

The product should remember the creator's source material, commercial offers, audience, approved language, sponsor commitments, and performance. Generation is one component. The value is coordinating the full system from idea to business result.

Creative prompt used for this concept

Premium campaign photograph of a Ghanaian fashion and lifestyle creator filming a vertical product story in a contemporary Accra studio. Show camera, phone, laptop, collaborators, natural materials, clean soft-white daylight, carbon-black styling, forest details, and a restrained signal-green practical light. Authentic, editorial, photorealistic, no logos, no readable text, no robots, and no excessive neon.

SECTION 10

Image and video intelligence

Creative generation becomes a managed business workflow.

Aksen can offer image and video generation as part of Studio and Campaigns. The sellable product is not the model output alone. It is a repeatable system that converts brand strategy into approved creative assets with consistent direction, provenance, and performance learning.

Image-generation services

- 96. Campaign concepts and visual territories.
- 97. Product and lifestyle scenes when traditional production is unavailable or unnecessary.
- 98. Storyboards, mood frames, pitch visuals, and pre-production exploration.
- 99. Platform-specific variations and controlled creative testing.
- 100. Background replacement, localization, seasonal adaptation, and image extension with approval.
- 101. Brand-safe prompt libraries and reusable art-direction presets.

Video-generation services

- 102. Concept development, scripts, shot lists, storyboards, and animatics.
- 103. Short brand films, social advertisements, product explainers, and motion-led demo stories.
- 104. Avatar or voice use only with explicit consent, identity controls, and disclosure where appropriate.
- 105. A human review gate before publishing or using generated people, claims, products, or sensitive scenarios.
- 106. Campaign versioning with a documented relationship between prompt, source assets, edit decisions, and final output.

Creative production workflow

- 107. Brief: objective, audience, message, channels, brand rules, claims, rights, and restrictions.
- 108. Concept: two or three creative territories with rationale and reference frames.
- 109. Approval: select one route before expensive generation or editing.
- 110. Production: create images, storyboard frames, clips, voice, music, and platform adaptations.
- 111. Quality control: inspect identity, hands, products, claims, continuity, typography, disclosure, and brand fit.
- 112. Publish: use approved channels and preserve a record of the final asset and approvals.

113. Learn: connect creative variants to meaningful performance signals and update the next brief.

SECTION 11

Video-generation example

Brand film concept: From Attention to Action.

Six-frame concept storyboard. Each final shot should be generated or filmed separately for continuity and editorial control.

Thirty-second story

Time	Picture	Narrative purpose
0-4 sec	Before sunrise, customer messages accumulate	Establish the cost of scattered attention
4-8 sec	The founder records a simple product story	Show authentic human input
8-14 sec	Aksen organizes content and conversations	Reveal useful intelligence, not magic
14-20 sec	Customers receive relevant answers and next steps	Turn understanding into action
20-26 sec	The team sees bookings and campaign learning	Connect activity to business outcomes
26-30 sec	Founder at golden hour over Accra	Land confidence and the brand promise

Voiceover draft

SCRIPT Every message is a signal. Every idea can create momentum. Aksen helps your business understand what matters, take the next action, and learn from every result. From attention to action.

Production-ready video prompt

Create a 30-second cinematic commercial following one Ghanaian woman entrepreneur in contemporary Accra. Begin in carbon-black predawn light with overwhelming but abstract customer notifications. Move into neutral soft-white daylight as she records a product story. Show a restrained intelligent workflow organizing conversations, content, approvals, and appointments. Signal green appears only when the system connects information or completes an action. End with her team reviewing clear results, then a confident natural-light portrait over Accra. Maintain exact identity, wardrobe, product, workspace, lens language, and color continuity. Premium commercial realism, natural movement, deep-forest surfaces, and restrained green system cues. No readable interface text, no robots, no floating brains, no Matrix code, no unsupported claims, no watermark.

SECTION 12

Agent design standard

Aksen agents must understand, act, explain, and recover.

Every production agent needs

- 114. A bounded job with explicit success and failure conditions.
- 115. Approved knowledge with source metadata, freshness, and ownership.
- 116. Structured tools with validated inputs and narrowly scoped permissions.
- 117. Conversation and workflow state that is appropriate to the use case.
- 118. Clear rules for uncertainty, refusal, escalation, and human handoff.
- 119. Approval gates for consequential, public, financial, or identity-sensitive actions.
- 120. Evaluation datasets covering common, difficult, ambiguous, and adversarial requests.
- 121. Observability for latency, model usage, tool failures, answer quality, and outcomes.

Agent loop

UNDERSTAND -> RETRIEVE -> DECIDE -> USE TOOL -> VERIFY -> RESPOND -> RECORD The user-facing answer is only one part of the system. Reliable execution depends on validation, permissions, tool results, and recovery behavior.

Response experience

- 122. Use clean plain language and short paragraphs.
- 123. Render structured results as native cards, options, timelines, or forms instead of raw Markdown.
- 124. Remove stray formatting markers, malformed bullets, repeated punctuation, and unsupported characters.
- 125. Preserve links, prices, dates, addresses, and property details exactly when they come from trusted data.
- 126. Separate what the agent knows, what it inferred, and what it needs from the user.
- 127. Confirm completed actions and provide a clear next step.

SECTION 13

Technical platform

A modular Next.js and Postgres foundation that can grow without premature complexity.

Layer	Initial choice	Responsibility
Experience	Next.js web application	Marketing site, Agent Lab, customer interfaces, admin
Agent runtime	Server-side TypeScript	Prompts, tools, policies, orchestration, streaming
Model gateway	OpenRouter	Model access, routing options, usage visibility, fallbacks
Operational data	Neon Postgres	Organizations, users, leads, conversations, tools, events
Knowledge	Postgres + pgvector	Documents, chunks, embeddings, semantic retrieval
Channels	Web first; WhatsApp adapter later	Channel-specific delivery without duplicating core logic
Observability	Structured events and evaluation logs	Quality, cost, latency, failures, outcomes
Media	Object storage and signed access	Images, video, transcripts, documents, generated assets

Architecture principles

- 128. Keep channel interfaces thin. Business logic belongs in shared services and tools.
- 129. Store structured business facts separately from generated text.
- 130. Version prompts, tools, knowledge sources, and agent configurations.
- 131. Record tool inputs, results, approvals, model choice, cost, and user-visible response.
- 132. Use model routing by job, risk, latency, and cost instead of one model for everything.
- 133. Do not expose database credentials, provider keys, system prompts, or internal tool traces to clients.
- 134. Design every action to be idempotent or safely retryable where possible.

Core data domains

Domain	Representative records
Tenancy	Organizations, workspaces, members, roles, permissions
Agent configuration	Agents, versions, prompts, policies, enabled tools
Knowledge	Sources, documents, chunks, embeddings, freshness, citations

Domain	Representative records
Conversations	Sessions, messages, participants, channel, consent
Execution	Tool calls, approvals, tasks, retries, errors, handoffs
Commercial	Contacts, leads, opportunities, bookings, outcomes
Creative	Briefs, source assets, generations, variants, approvals, rights
Analytics	Events, usage, cost, latency, evaluations, attribution

SECTION 14

Trust, safety, and governance

Trust must be visible in the product, not hidden in policy documents.

Minimum controls

- 135. Tenant isolation and role-based access to business data and agent controls.
- 136. Secrets stored outside source code and rotated after exposure or staff changes.
- 137. Consent and purpose limits for customer messages, creator likeness, voice, and private content.
- 138. Source-level permissions and removal workflows for knowledge documents.
- 139. Human approval before public publishing, financial commitment, sensitive outreach, or irreversible actions.
- 140. Audit logs that connect the user request, agent decision, tool action, approval, and outcome.
- 141. Retention rules appropriate to the client, channel, and data category.
- 142. Incident response and the ability to disable an agent, tool, channel, or model quickly.

HUMAN CONTROL IS PART OF THE PRODUCT

Human-control ladder: autonomy expands only as consequence and confidence allow.

Truthfulness standard

The agent must prefer an honest limitation over a confident invention. Retrieved facts should carry sources where useful. Generated recommendations should be distinguishable from verified business data. Pricing, availability, legal claims, medical claims, and financial claims require special controls or human review.

Creative rights standard

- 143. Confirm the customer has rights to source images, footage, music, scripts, logos, and voices.
- 144. Require explicit consent before generating or editing a recognizable person's likeness or voice.
- 145. Track where generated assets came from and which version was approved.
- 146. Support platform disclosure requirements and customer disclosure policies.
- 147. Do not represent concepts or simulations as completed client work.

SECTION 15

Business model

Services generate learning and cash flow; reusable software increases margin and scale.

Offer	Customer receives	Commercial hypothesis
AI Opportunity Sprint	Workflow audit, opportunity map, pilot definition, data and risk plan	Fixed-fee diagnostic
Focused Pilot	One deployed workflow, measurement baseline, training, and pilot report	Setup fee plus pilot support
Transformation Partnership	Multiple agents, integrations, change management, and roadmap	Milestone-based implementation
Managed Agent Operations	Monitoring, evaluation, knowledge updates, optimization, and support	Recurring monthly retainer
Aksen Platform	Reusable workspace, agent modules, analytics, roles, and connectors	Subscription after repeatability is proven
Creative Campaign Systems	Brief-to-asset production, approvals, adaptations, and learning	Project fee or recurring studio plan

Pricing hypotheses for discovery

These ranges are testable anchors, not a public price list. Final pricing must reflect workflow value, integration complexity, risk, model usage, support load, and the customer's market.

Offer	Ghana-focused hypothesis	International hypothesis
Opportunity Sprint	GHS 5,000 to 12,000	USD 750 to 2,000
Focused Pilot	GHS 20,000 to 60,000	USD 3,000 to 10,000
Managed Operations	GHS 3,500 to 18,000 monthly	USD 500 to 3,000 monthly
Transformation	Scoped after discovery	Scoped after discovery

Commercial discipline

148. Do not offer unlimited model usage inside a fixed fee without clear limits.

149. Separate implementation, recurring software, third-party usage, and managed support in proposals.

150. Price against business value and risk, then verify that delivery margins remain healthy.

151. Use pilot terms that permit an anonymized case study only when the client explicitly agrees.
152. Avoid custom features that cannot become reusable patterns unless the client funds the exception.

SECTION 16

Go-to-market

Demonstration-led selling supported by precise, research-driven outreach.

Initial sales motion

- 153. Choose one target account and one costly visible workflow.
- 154. Research the company using public information and identify the likely economic buyer.
- 155. Build a short, clearly labelled concept demonstrating the future customer experience.
- 156. Send a concise personalized message that leads with the observed opportunity, not a list of AI features.
- 157. Use the live demonstration to earn a discovery conversation.
- 158. Define a narrow pilot with a baseline, success event, approval model, and owner.
- 159. Deliver quickly, measure honestly, and request permission to publish proof.
- 160. Turn the strongest implementation patterns into templates and product modules.

Three-day Proptis outreach target

Day	Outcome	Actions
Day 1	Decision-maker map	Identify founder, managing director, commercial lead, and credible warm-introduction paths
Day 2	Outreach assets	Polish demo, record a 60 to 90 second walkthrough, prepare email and LinkedIn message
Day 3	Contact and follow-up	Send personalized outreach, track response, prepare discovery questions, schedule first follow-up

Channel mix

- 161. Founder-led email with a personalized subject and a direct demonstration link.
- 162. LinkedIn connection and short message to relevant decision-makers.
- 163. Warm introductions through customers, accelerators, property professionals, agencies, and mutual contacts.
- 164. Short teardown content showing what a better customer journey could look like.
- 165. Workshops and small events centered on practical AI workflows, not broad trend talks.

166. Partner referrals from web studios, marketing agencies, CRM implementers, and business consultants.

SECTION 17

Delivery model

A repeatable path from opportunity to controlled production.

- 167. Discover: interview owners and operators, map the current workflow, identify costs, risks, and desired outcomes.
- 168. Baseline: capture present response time, completion rate, workload, quality, or another relevant measure.
- 169. Design: define the agent's job, data, tools, permissions, escalation, interface, and success criteria.
- 170. Prototype: build a guided experience using representative data and restricted actions.
- 171. Evaluate: test common, ambiguous, high-risk, and failure scenarios before external use.
- 172. Pilot: launch to a bounded audience, channel, location, or team with human oversight.
- 173. Measure: compare outcomes, quality, adoption, cost, latency, and operational burden against baseline.
- 174. Expand: automate only proven steps and add adjacent workflows when ownership and value are clear.

Pilot acceptance criteria

- 175. Named executive sponsor and operational owner.
- 176. Approved knowledge and access to required systems.
- 177. Defined users, channels, hours, scope, exclusions, and escalation contacts.
- 178. A measurable completion event and an agreed baseline.
- 179. A quality review process with representative test cases.
- 180. A rollback or shutdown path for failed behavior.
- 181. A written decision at pilot end: stop, revise, expand, or operationalize.

Roles for the founding stage

Role	Immediate responsibility	When to add
Founder / commercial lead	Vision, research, sales, discovery, partnerships, account ownership	Now
Product and engineering	Agent core, demos, integrations, reliability, architecture	Now

Role	Immediate responsibility	When to add
Product designer	Brand system, interaction design, demos, customer experience	Fractional or project
AI creative director	Image and video systems, quality control, client creative	Fractional initially
Implementation specialist	Knowledge setup, testing, onboarding, support	After repeat pilots
Domain advisor	Industry workflow credibility and introductions	Per vertical

SECTION 18

Roadmap

Prove demand before building the full platform.

Phase 1: Foundation, days 0 to 30

- 182. Finalize the working brand direction and create the first Aksen web blueprint.
- 183. Harden the Proptis demonstration and prepare a short walkthrough.
- 184. Create the Agent Lab shell and transparent status labels.
- 185. Build a guided Creator Growth or Social Sales demonstration.
- 186. Prepare discovery, pilot, proposal, and evaluation templates.
- 187. Begin focused founder outreach and conduct at least ten discovery conversations across chosen segments.

Phase 2: First proof, days 31 to 90

- 188. Close and deliver the first paid pilot.
- 189. Implement organization-level tenancy, agent configuration, event logs, and approval flows.
- 190. Add the Opportunity Mapper as a lead qualification experience.
- 191. Measure pilot economics, agent quality, user adoption, and delivery effort.
- 192. Publish the first permissioned case study or anonymized proof story.
- 193. Choose the second wedge based on willingness to pay, not enthusiasm alone.

Phase 3: Repeatability, months 4 to 6

- 194. Standardize onboarding, knowledge ingestion, tools, evaluation, and analytics.
- 195. Launch reusable templates for the strongest vertical and workflow.
- 196. Add customer workspaces, roles, usage controls, and billing readiness.
- 197. Develop partner channels with agencies and technology implementers.
- 198. Document gross margin, support burden, retention indicators, and expansion paths.

Phase 4: Platform, months 7 to 12

- 199. Offer self-serve configuration only for workflows that are genuinely repeatable.
- 200. Expand channel adapters and the shared analytics layer.
- 201. Introduce reusable creative and campaign workflows.

202. Build vertical packs based on multiple paying implementations.

203. Evaluate regional and international expansion from evidence gathered during delivery.

SECTION 19

Metrics and defensibility

Measure outcomes, reliability, economics, and learning velocity.

Company metrics

Area	Questions to answer
Demand	How many qualified conversations, proposals, pilots, and paying customers are created?
Value	Which measurable customer outcomes improve, and by how much?
Quality	How often are responses useful, grounded, safe, and completed without correction?
Reliability	How often do tools, channels, and workflows complete successfully?
Adoption	Do customers, operators, and end users return and complete meaningful tasks?
Economics	What are model, infrastructure, support, and implementation costs per outcome?
Speed	How quickly can a new customer or vertical be configured from reusable components?
Learning	How rapidly do pilots improve prompts, tools, evaluation sets, and templates?

Potential moat

- 204. Workflow intellectual property captured from real implementations.
- 205. Local channel knowledge, operating context, and relationships.
- 206. Reusable evaluation sets and outcome data for specific agent jobs.
- 207. A services-to-product loop that exposes actual customer constraints.
- 208. Trust architecture, approval patterns, and operational playbooks.
- 209. A visible Agent Lab that makes complex capability easy to understand and buy.
- 210. Cross-product learning between customer conversations, content, marketing, and operations.

DEFENSIBILITY TEST If the value disappears when another model becomes cheaper, we have built a wrapper. The defensible value must live in workflow design, data, integrations, trust, outcomes, and customer relationships.

SECTION 20

Risks and countermeasures

Move quickly without confusing speed with carelessness.

Risk	Early countermeasure
Market breadth creates confusion	Use one umbrella narrative and sell one narrow outcome per campaign
Generic AI features are copied	Own workflow, integration, evaluation, and operating experience
Platform API restrictions	Use official APIs, approval gates, and honest integration labels
Incorrect or invented answers	Ground responses, validate structured facts, test, and escalate uncertainty
Sensitive data exposure	Tenant isolation, least privilege, secret management, and retention controls
Creative rights or likeness issues	Consent, provenance, review, and disclosure workflows
Custom work destroys margin	Template common patterns and charge for funded exceptions
Usage costs become unpredictable	Model routing, budgets, caching, limits, and cost-per-outcome reporting
Demo is mistaken for client endorsement	Label independent concepts and simulations clearly
Founder overload	Standardize discovery and delivery; prioritize one active wedge at a time

Security action already required

ROTATE EXPOSED CREDENTIALS Any database connection string or API key shared in chat or committed to a repository should be treated as exposed, rotated, moved into protected environment variables, and removed from logs and source history where applicable.

SECTION 21

Open decisions and discovery agenda

Evidence needed before irreversible commitments.

Founding decisions

Decision	Current recommendation	Evidence needed
Company name	Aksen Labs as working name	Registry, trademark, domain, and pronunciation checks
First commercial wedge	Property concierge	Decision-maker access and paid pilot interest
Second product wedge	Social Sales or Creator Growth	Interviews with creators, agencies, and service businesses
Business model	Services-first with platform underneath	Delivery margin and repeatability across three pilots
Primary channel	Web demonstration first	Customer demand and official API feasibility for WhatsApp/social
Public pricing	Keep private during discovery	Close-rate and willingness-to-pay evidence

Discovery questions for prospective clients

211. Which customer or internal workflow creates the most delay, repetition, or lost opportunity?
212. How does the workflow operate today, and who owns the result?
213. What information must be correct every time?
214. Which actions can the agent suggest, prepare, or complete?
215. Where must a human approve or take over?
216. Which tools and channels are already used?
217. What outcome would make a four-week pilot commercially worthwhile?
218. What data, privacy, brand, legal, or operational constraints must be respected?

SECTION 22

Thirty-day execution plan

Build proof, earn conversations, and keep the platform coherent.

Week	Product	Commercial	Brand and content
1	Stabilize Proptis demo; instrument key events	Create target-account list and outreach assets	Approve Aksen working identity and site narrative
2	Build Agent Lab shell and demo metadata	Start personalized outreach and interviews	Create short demo walkthrough and founder posts
3	Build Creator Growth or Social Sales guided demo	Run discovery calls; draft first pilot proposal	Publish one concept teardown and one agent explainer
4	Add Opportunity Mapper prototype and analytics	Pursue pilot decision and partner introductions	Review evidence and update this blueprint

Definition of a successful first month

- 219. The Aksen story is clear enough that a decision-maker can repeat it accurately.
- 220. The Proptis demo is stable, honest about its status, and easy to experience.
- 221. At least one second demo proves the horizontal platform narrative.
- 222. Customer discovery produces specific workflow, budget, and decision-process evidence.
- 223. A paid pilot proposal is in front of a qualified buyer.
- 224. The core platform captures events, costs, failures, and meaningful outcomes.

SECTION 23

Messaging bank

Copy foundations for the website, outreach, and presentations.

Homepage hero

HEADLINE AI agents that turn attention into action.

We design intelligent systems that answer customers, qualify leads, create campaigns, automate workflows, and help teams make better decisions.

Three outcome pillars

Pillar	Message
Convert	Turn customer enquiries, social engagement, and demand into qualified next steps.
Create	Turn knowledge, ideas, and source content into approved campaigns and creative assets.
Operate	Turn repetitive business workflows into controlled, intelligent systems.

Proof language

- 225. Not just an answer. A completed next step.
- 226. Your knowledge, your tools, your controls.
- 227. Automate the repetitive. Keep people in control of the important.
- 228. See what the agent understood, used, and completed.
- 229. Start with one workflow. Build an intelligent operating layer over time.

Short outreach opening

I noticed an opportunity to make your customer journey faster and more useful, especially when someone is searching, comparing options, or contacting the team after hours. We built a short independent concept to show how an AI concierge could answer questions, qualify interest, and prepare the next action. I would value twenty minutes to understand how the workflow operates today and whether a focused pilot would be useful.

SECTION 24

Implementation references

Primary documentation supporting key technical and channel assumptions.

Neon: AI concepts and pgvector

Neon documents how pgvector can store and retrieve embeddings directly in Postgres.

OpenRouter: Quickstart

OpenRouter documents a unified API, model access, SDK options, tool use, and routing patterns.

TikTok: Content Posting API

TikTok documents creator authorization, posting scopes, audits, and restrictions for unaudited clients.

YouTube Data API

YouTube documents authenticated video and channel operations.

YouTube Analytics API

YouTube documents channel analytics queries and reporting.

YouTube: altered or synthetic content

YouTube explains when realistic altered or synthetic content requires disclosure.

Important note

Platform policies, model availability, prices, legal requirements, and API capabilities change. Re-check official documentation during implementation and before making commitments to customers.

Founding conclusion

THE COMPANY WE ARE BUILDING Aksen Labs is a focused agentic growth company with a reusable platform underneath. It wins trust through working demonstrations, enters through measurable workflows, expands through useful adjacent agents, and treats design, safety, and commercial outcomes as one product discipline.

SECTION 25

Business assessment and timing

A strong opportunity, provided focus and operating discipline arrive before scale.

FOUNDER VERDICT 8.4 / 10. Aksen is entering at the right moment: demand is rising, reliable implementation remains difficult, and local businesses need partners who can translate AI into useful work. The opportunity becomes weaker if Aksen tries to serve every industry or competes as another low-price chatbot vendor.

Why this is a good time

- 230. Microsoft reports that 81% of leaders expect agents to be integrated moderately or extensively into company AI strategy within 12 to 18 months.
- 231. Gartner expects agentic capabilities to enter far more enterprise applications, while warning that unclear value, cost, and weak controls will cancel many projects. That creates room for outcome-led implementation partners.
- 232. Ghana's digital sector, internet adoption, public digital investment, and 2026 National AI Strategy create a more receptive market and a growing base of connected customers and businesses.
- 233. The gap is not access to a model. The gap is workflow understanding, trustworthy tools, useful data, integration, evaluation, change management, and sustained improvement.

What prevents a 10 / 10

Gap	What it could cause	Aksen response
Too many industries	Diluted story and scattered delivery	Choose one 90-day commercial wedge while keeping the platform horizontal
No paid proof yet	Long sales cycles and weak pricing power	Turn the first pilot into verified before-and-after evidence
Commodity chatbot market	Price pressure below sustainable service levels	Sell workflow transformation, controls, integration, and measured outcomes
Founder capacity	Custom work overwhelms sales and product learning	Use stage gates, templates, change control, and one active wedge at a time
Governance debt	Privacy, security, or reputation failure	Make consent, least privilege, retention, audit, evaluation, and incident response launch requirements
Distribution gap	A good product that few buyers discover	Connect founder content, live demonstrations, targeted outreach, partners, and referral loops

SECTION 26

Competitive landscape

Know which fight to avoid and where Aksen can earn a premium.

Ghana and nearby market

Provider	What it sells	Public price signal	Implication
XCelerate AI	Omnichannel support and sales automation, catalogues, booking, payments, and follow-up	GHS 150 / 600 / 1,800 monthly tiers	A direct benchmark for the low-price productized chatbot category
AgentGH	WhatsApp-first AI receptionist for small businesses	GHS 100 activation; GHS 500 monthly pilot	Confirms local demand and strong price pressure at the entry level
Npontu	Enterprise AI, data, analytics, automation, and sector solutions	Custom	Strong local enterprise capability; Aksen must win with experience, speed to proof, and reusable vertical workflows
Daidatec	Approved-knowledge assistants and workflow automation	Custom; prototype-led entry	Aksen needs superior commercial packaging and outcome evidence
Automation studios	n8n, Make, Zapier, and AI implementations	Usually custom	Sell the business result, not a tool configuration

Global benchmarks

Provider	Model	Current public signal	Lesson
Intercom Fin	AI support outcomes	\$0.99 resolution-class outcome; \$9.99 qualified lead, plus platform	Outcome pricing works when definitions and baselines are precise
Lindy	General AI employees	About \$29.99 to \$199.99 per user/month	Credits package usage; Aksen should explain cost but sell value
Relevance AI	Agent building platform	Free; paid individual and team tiers; enterprise custom	Tools are becoming cheap; implementation and governance carry the premium
Voiceflow	Conversational agent platform	Business and agency offers increasingly quote-led	Use as an accelerator if useful, but own workflow, data, evaluation, and relationship

Provider	Model	Current public signal	Lesson
n8n	Workflow automation infrastructure	Hosted execution tiers and community self-hosting	Infrastructure can reduce build time without becoming the customer proposition
HubSpot / work platforms	CRM and project operations	Free entry and per-seat paid tiers	Integrate commodity functions; do not rebuild full CRM or project suites

POSITIONING DECISION Aksen should own the space between cheap generic bots and slow enterprise transformation: a focused, measurable AI workflow designed, launched, governed, and improved by one accountable partner.

SECTION 27

Pricing and commercial design

Charge separately for discovery, implementation, operations, external usage, and proven outcomes.

Offer	Indicative price	Buyer receives
Opportunity Sprint	GHS 5k-12k / USD 750-2k	Workflow map, baseline, risks, pilot design, success measures, and recommendation
Focused Pilot	GHS 20k-60k / USD 3k-10k	One bounded workflow over about four to six weeks, with evaluation, controls, and launch support
Managed Agent Operations	GHS 4k-18k monthly / USD 600-3k	Monitoring, support, improvements, reporting, evaluation, and agreed change allowance
Transformation Programme	GHS 60k-250k+	Multiple connected workflows, integrations, governance, training, and operating-model change
Outcome component	Added after a baseline exists	An agreed fee or bonus for qualified leads, bookings, support outcomes, or another verified result
External usage	Allowance plus transparent overage	Model, WhatsApp, voice, email, storage, and licensed enrichment costs

Pricing rules

- 234. Never promise unlimited AI usage inside a custom service without an explicit fair-use and overage policy.
- 235. Use fixed-fee discovery and pilot stages to make buying easier while protecting scope.
- 236. Require a measurable baseline before outcome pricing; define attribution, exclusions, and audit evidence in writing.
- 237. Use milestone payments and a change budget for transformation programmes.
- 238. Keep public product prices provisional until at least three comparable paid implementations reveal real delivery and support economics.

DO NOT RACE TO THE BOTTOM The GHS 150-600 chatbot category is already occupied. Aksen should make the first paid step accessible, but the core offer must remain a serious business improvement engagement.

SECTION 28

Aksen OS

The internal operating system that connects demand, delivery, agents, knowledge, and outcomes.

What it is

Aksen OS is not a dashboard placed beside the business. It is the record of how the business works. Every lead, promise, project decision, agent version, approval, incident, reusable asset, and customer outcome becomes part of one traceable operating system.

Module	Core responsibility	Why it matters
Command centre	Pipeline, project health, deadlines, approvals, incidents, revenue and activity	Gives the founder one honest view of what needs attention
CRM	People, companies, leads, opportunities, conversations, consent, score and next action	Connects every public interaction to a commercial record
Sales workspace	Discovery, opportunity map, proposal, scope, pricing and approval	Turns interest into a disciplined buying journey
Project delivery	Scope, milestones, work, risks, decisions, deliverables, cost, acceptance and learning	Manages engagements from promise to verified outcome
Client records	Stakeholders, agreements, systems, data, knowledge, deployments and service health	Keeps delivery context reusable and permissioned
Agent operations	Registry, versions, tools, permissions, runs, evaluations, cost, approvals and incidents	Lets Aksen demonstrate the operating discipline it sells
Support inbox	Conversation, ticket, urgency, confidence, handoff, resolution and feedback	Joins customer care to product and delivery learning
Content studio	Idea, sources, draft, review, publish, distribute, repurpose and attribute	Makes the blog a demand and trust engine
Knowledge hub	Playbooks, templates, prompts, vertical patterns, sources and freshness	Captures reusable intellectual property
Finance-lite	Quote, invoice status, recurring revenue, cost and margin estimate	Supports commercial decisions without rebuilding accounting

SECTION 29

End-to-end project lifecycle

Every stage has an owner, evidence, gate, and next action.

Stage	Required evidence	Exit gate
Capture and enrich	Source, consent, company context, problem signal, contact path	A real account with evidence and an assigned owner
Qualify	Need, urgency, authority, budget range, current workflow, next action	Discovery is worth the buyer's and Aksen's time
Discover	Workflow map, baseline, users, systems, risks, success definition	The problem and pilot boundary are agreed
Propose	Scope, deliverables, exclusions, price, responsibilities, timeline, controls	Approved statement of work and payment trigger
Onboard	Stakeholders, access, data classification, knowledge, communication rhythm	A safe, testable environment is ready
Design and build	Architecture, tool contracts, prompts, user paths, evaluation cases	Acceptance criteria can be tested
Evaluate and approve	Test results, failures, security review, human-control review	Named owner approves release
Launch and observe	Run trace, cost, latency, incidents, outcomes, user feedback	System is stable enough for normal operation
Optimize	Outcome review, failure patterns, improvement backlog, updated evaluation	Changes improve value without unacceptable risk
Expand or close	ROI summary, renewal decision, reusable assets, case-study permission	Retainer, next workflow, referral, or clean handover

OPERATING RULE No silent handoffs. The system should always show who owns the next action, what evidence is missing, and what decision unlocks the next stage.

SECTION 30

Multi-agent operating architecture

A supervised team of bounded workers, not an autonomous swarm.

Architecture in plain language

One coordinator receives work, checks policy and context, and gives a bounded job to the right specialist. Specialists can read or draft only what their role permits. Consequential actions wait for a person. Every run leaves evidence that can be reviewed, measured, and improved.

Agent	Primary job	First-release control
Front Door	Answer, guide, qualify, and create a useful handoff	Cannot invent prices, promises, or unsupported claims
Enrichment	Create an evidence-backed company profile	Business and licensed sources only; attach source and confidence
Sales Copilot	Summarize discovery and recommend next steps	Every external message and commercial commitment is approved
Solution Architect	Draft a bounded workflow, risk model, pilot, and success measures	Technical and commercial owners approve scope
Proposal	Prepare statements of work from approved modules	Human approves and sends
Project Coordinator	Maintain project state, status, blockers, and follow-ups	Cannot change scope, spend, or acceptance
Knowledge Steward	Prepare sources, metadata, access, and freshness warnings	Sensitive sources and permissions require approval
Evaluation	Test versions, compare outputs, and flag regressions	Release gate blocks weak versions
Support	Resolve bounded questions and triage incidents	Escalates uncertainty, sensitivity, anger, and high impact
Content Research	Produce sources, claims, angles, and counterpoints	No unsourced publication
Editorial	Draft articles and repurpose founder thinking	Founder approves publication
Pulse	Detect commercial, delivery, reliability, and cost signals	Cannot change budgets or contact customers automatically

Technical layers

239. Experience: website, blog, conversation, admin, and later client portal.

- 240. Application API: identity, tenancy, policy, validation, rate limits, and typed services.
- 241. Orchestration: jobs, workflow state, retries, idempotency, routing, and approval waits.
- 242. Agent registry: instructions, model policy, tools, permissions, versions, budgets, and deployments.
- 243. Knowledge and tools: approved sources, retrieval, citations, integrations, and safe actions.
- 244. Data: Neon Postgres as system of record, pgvector for retrieval, and object storage for files and media.
- 245. Trust and operations: traces, cost, latency, evaluation, incidents, approvals, secrets, and emergency stop.

SECTION 31

Lead, support, and content engines

Three public experiences feeding one operating system.

Conversational front door

- 246. Answer from approved Aksen knowledge and show a useful source or scope cue when it matters.
- 247. Understand the visitor's industry, workflow, problem, current tools, volume, urgency, and desired outcome through a guided conversation.
- 248. Create or update the lead, preserve consent and source, attach the conversation summary, and suggest the correct next action.
- 249. Offer an appropriate demonstration, article, opportunity call, or support handoff instead of forcing every visitor into the same form.
- 250. Escalate uncertainty and never make contractual, legal, security, delivery, or pricing commitments without approval.

Enrichment boundary

RECOMMENDED STARTING POLICY Enrich companies and domains from licensed or clearly permitted business sources. Use contact information the person supplies. Defer large-scale personal decision-maker enrichment and autonomous outreach until Aksen has an approved provider, lawful basis, consent and objection handling, retention rules, and a reviewed outreach policy.

Blog and founder media

Series	Promise to the reader	Commercial connection
AI in Practice	What a real workflow looks like before and after	Links to a relevant demonstration or opportunity map
Work and Productivity	Ways people and agents can work better together	Builds trust with operators and team leaders
Tools We Tested	Honest reviews, trade-offs, and use cases	Creates search demand and practical authority
Build Notes	What Aksen built, learned, measured, or changed	Turns internal progress into credible proof
African AI	Local context, policy, businesses, talent, and opportunity	Builds a distinctive regional point of view

Series	Promise to the reader	Commercial connection
Client Playbooks	Reusable approaches without exposing confidential information	Educates serious buyers and shortens discovery

SECTION 32

Build roadmap

Prove the operating loop before adding platform breadth.

Phase	Time	Deliverable	Gate
0. Decisions and controls	1 week	Target segment, roles, system of record, stages, metrics, permissions, retention, and evaluation policy	Founder confirms the operating defaults
1. Foundation	2-3 weeks	Neon schema, authentication, roles, audit events, admin shell, CRM core, blog, opportunity mapper, and Front Door Agent	A public conversation creates a traceable, useful lead
2. Delivery OS	3-4 weeks	Projects, milestones, work, risks, decisions, deliverables, acceptance, proposal, onboarding, and project health	One engagement can be managed from discovery to retrospective
3. Agent operations	3-4 weeks	Agent registry, tools, permissions, runs, approvals, incidents, evaluation, cost, and first specialist agents	A version cannot launch without evidence and approval
4. Growth engine	2-3 weeks	Editorial workflow, distribution, attribution, shared inbox, scoring, and expansion signals	Content and conversations create measurable pipeline
5. Productization	Evidence-led	Client portal, vertical packs, usage controls, billing readiness, WhatsApp, SLA, and partner tools	A pattern has succeeded in at least three comparable paid implementations

Build now

Founder and collaborator access, CRM core, opportunity mapper, blog, lead and support agent, project lifecycle, agent evidence, approval foundation, and audit events.

Integrate or defer

Accounting, payroll, full email marketing, full calendar, advanced resource planning, public self-service agent building, autonomous outbound, deep personal enrichment, automated billing, and a full client portal.

SECTION 33

Trust, data, and operational controls

The system must be safe enough to become proof of Aksen's method.

- 251. Use organization and workspace identifiers throughout the schema even while Aksen is the only organization.
- 252. Separate identity, membership, role, permission, and project ownership.
- 253. Record consent, source, purpose, retention category, and legal basis for personal information used in marketing or enrichment.
- 254. Give each agent and tool least-privilege scopes: read, draft, request approval, or act.
- 255. Keep external credentials in protected secrets, never prompts, source control, logs, or browser-visible configuration.
- 256. Log the agent version, model, context sources, tool calls, approvals, errors, provider cost, latency, and final outcome.
- 257. Maintain evaluation cases for factuality, policy, tool selection, handoff, tone, refusal, and domain-specific accuracy.
- 258. Provide incident records, rollback, version promotion, budget limits, and an emergency disable control.
- 259. Treat Ghana Data Protection Commission registration, privacy notices, processor terms, retention, breach response, and cross-border processing as launch work.

SECURITY REMINDER Rotate the Neon database credential and OpenRouter key previously shared in chat before any public launch. The prototype can continue against protected environment variables, but exposed credentials should not be treated as permanent secrets.

SECTION 34

Founder decisions before implementation

Seven answers that shape the schema, permissions, product scope, and first sales motion.

Question	Recommended default
Who uses the admin in the first three months?	Founder plus invited collaborators with role-based access; client access later
What is the primary system of record?	Neon Postgres for Aksen OS; retain the current site database only temporarily or as an edge cache
Which segment owns the next 90 days?	Property and customer-facing service businesses, using Proptis as the proof wedge
Who is the commercial buyer?	Mid-market founders and decision-makers; do not build the core economics around micro-SME chatbot pricing
Who can publish to the blog?	AI can research and draft; the founder approves every publication in the first release
How far can enrichment go?	Company and domain information plus user-provided contacts first; licensed personal enrichment later
Is a client portal part of the MVP?	No. Stabilize internal delivery, then add a read-only client status and approval experience

Implementation start condition

If the founder accepts these defaults, Phase 1 can begin immediately. A changed answer is not a problem, but it must be resolved before it becomes an expensive database, permission, or product decision.

SECTION 35

Strategy and market references

Authoritative evidence and public competitor benchmarks used for version 0.4.

Microsoft: 2025 Work Trend Index

Agent adoption expectations and the capacity gap reported across 31 markets.

Gartner: agentic AI project outlook

Adoption forecast, agent-washing warning, and project cancellation risk.

World Bank: Ghana Digital Acceleration

Ghana digital-sector growth and public digital investment.

World Bank: digital adoption in Ghana

Internet adoption and urban-rural context.

Ghana Ministry: National AI Strategy

Official 2026 launch and national direction.

UNESCO: Ghana AI readiness

Readiness work and priority sectors.

Ghana Data Protection Commission

Primary data-protection law.

Anthropic: Building effective agents

Simple, composable workflows and agents.

OpenAI: A practical guide to building AI agents

Use-case selection, orchestration, guardrails, and human intervention.

Microsoft Learn: multi-agent architecture patterns

Least privilege, orchestration, and platform security.

XCelerate AI

Local omnichannel product and public pricing benchmark.

Npontu AI and intelligent automation

Local enterprise AI and data competitor.

Daidatec AI automation

Local implementation and prototype-led competitor.

Intercom Fin outcome pricing

Outcome definitions and public outcome prices.

Lindy pricing

General agent credit and tier benchmark.

Relevance AI pricing

Agent platform action pricing.

Voiceflow pricing

Conversational agent platform benchmark.

n8n pricing

Workflow infrastructure and execution pricing benchmark.

VERSION 0.4 CONCLUSION Build Aksen OS as a disciplined internal proof of the company: one operating loop from attention to outcome, a supervised agent team with clear permissions, a founder-led knowledge and content engine, and a services business that productizes only what paid delivery proves repeatable.
