

BUSINESS ASSESSMENT AND 90-DAY LAUNCH PLAN

Building a practical AI operations business

Prepared for the founder | Aksen Labs working project

Overall assessment: 6.5 out of 10 today. This is an equal-weight judgment across six dimensions, not a statistical prediction of success. The business merits a focused commercial test. Its next milestone is a paid, repeatable workflow with an operating retainer and documented results.

Dimension	Score	Reason
Customer problem	8/10	Enquiry handling, handoffs and repetitive administration are concrete jobs. Target buyers' actual pain and budgets still need measurement.
Founder delivery evidence	7/10	You confirm past paid project work. Project types, profit, client satisfaction and permission to show the work remain unverified.
Product foundation	7/10	Commercial documents, a public platform and internal records exist in code. Production reliability has not been established by this review.
Offer focus	6/10	The blueprint connects discovery, implementation and management, but the catalogue spans many services and industries.
Recurring economics	6/10	Ongoing monitoring can justify recurring fees. There is no recurring revenue or measured support cost yet.
Repeatable acquisition	5/10	Past sales are useful evidence; this plan assumes no warm pipeline and no proven acquisition channel.

Recommendation: build a Ghana-first workflow implementation and managed-operations company. Begin with enquiry-to-handoff and proposal/onboarding work. Use AI where interpretation or drafting helps; use clear rules for prices, permissions, state changes and calculations.

The founder's confirmation of prior payments updates the blueprint's earlier pre-sales framing. It does not establish paying Aksen subscriptions, a Proptis contract or recurring demand. This report proposes a tighter profile and pricing; it does not silently replace accepted project decisions.

Success in the first 90 days means evidence: one or two paid pilots where capacity permits, measured delivery economics, and at least one paid operating agreement as a target. These are operating goals, not promised sales.

Planning assumptions: Ghana is the first market; founder-led delivery; no warm pipeline. Weekly capacity, cash budget, legal entity status and historic financials remain unknown. Timing and growth scenarios are conditional on those inputs.

STRATEGY NOTE 02

What the current evidence supports

Ghana's 2024 business census counted 1,867,695 establishments, including 1,689,146 micro establishments; services accounted for 76.7%. Establishments are not unique prospective clients, and the census size bands have not been equated with the project's 10-100 employee target. This supports selective prospecting, not a million-customer market claim. [GSS 2024 IBES I factsheet; reference year 2024, exact publication date unverified](#).

NCA reports 29,727,471 mobile-data subscriptions in Q1 2026. Subscriptions are not unique people or business buyers. A mobile-friendly experience is a reasonable design inference; these figures do not establish WhatsApp use or willingness to buy AI services. [NCA Q1 2026 statistical bulletin; January-March 2026](#).

McKinsey's 25 August 2026 survey reports 44% scaling AI across their enterprise and 37% reporting positive EBIT contribution. Its 1,719 respondents across 97 countries include substantial large-enterprise representation. This is a global implementation signal, not a Ghana SME demand estimate. The same survey reports that 32% had forgone buying at least one software product or feature because they could build it using agentic coding tools: easier software creation is also competitive pressure. [McKinsey, The state of AI in 2026; fieldwork May-June 2026](#).

Interpretation: the opportunity is to own a useful business process through implementation, staff adoption and ongoing care. The evidence does not support selling technical novelty at a premium by itself.

What is supported	What remains unproven
Local automation firms publish concrete offers.	What target buyers actually pay and how often they renew.
The project has reusable delivery foundations.	Reliability, deployment effort and recurring margin at client scale.
The founder has previously been paid.	A predictable funnel for this specific offer.

No defensible Ghana-specific AI-services market size or growth rate was established. The growth section therefore uses explicit scenarios and capacity constraints.

STRATEGY NOTE 03

A tighter business profile

Category: AI workflow implementation and managed operations.

One-line description: We set up and run practical AI workflows that connect your enquiries, business tools and team, so work moves from request to completion with less manual chasing.

Company profile: We help growing service businesses organize customer enquiries, prepare follow-up, and move approved work into delivery. We map a specific process, connect the tools and information the team already uses, add AI where it improves the work, and train staff to operate the system. After launch, we monitor failures, maintain approved knowledge and integrations, and review results with the business owner. Each engagement has a defined scope, a named owner and measurable acceptance criteria.

This is proposed positioning. Statements about monitoring and delivery describe the service to establish; do not present them as existing client results until fulfilled.

Public offer structure: Assess -> Implement -> Operate. Explain the business job before explaining orchestration. Keep websites, creative production and broad transformation available as separately scoped supporting services; make the core buying journey about one operational problem.

Initial test cohort	First job	Proof to seek
Property agencies with regular enquiries and maintained listings	Enquiry qualification, approved answers and viewing handoff	Follow-up completion, qualified viewing requests, response time
Commercial cleaning and maintenance firms handling repeated quotes	Enquiry intake, quote preparation and approved job handoff	Quote turnaround, administrative minutes per enquiry, handoff completeness

The second cohort is a test hypothesis informed by the local Youth Alive service-work prototype, not a claim about a paying client or proven segment demand. Prioritize whichever cohort provides accessible records, an accountable buyer and paid commitment. Use REAC to verify property practitioners where relevant. [REAC Public Registry; undated, checked 4 September 2026](#).

Treat 10-100 employees as a prospecting aid. More important filters are recurring work volume, demonstrable delay or error, a maintained information source, ability to approve a purchase, and enough economic benefit to cover implementation and care. A five-person firm can qualify; a larger firm with no owner or clean process can fail.

STRATEGY NOTE 04

A better name with an honest screening result

Preferred candidate for testing: Kordara Systems. Suggested pronunciation: kor-DAH-ra. The intended brand association is coordination and connected work; this is a creative association, not a claimed linguistic origin. Use the descriptor "AI workflows and managed operations" beneath the name.

It is broader than a single tool and "Systems" makes the delivery focus clearer than "Labs." These are editorial judgments. Before choosing it, test whether five prospective buyers can say it, spell it after hearing it, and explain what the descriptor means.

Name	Screening result on 4 September 2026	Decision
Kordara Systems	No obvious exact business match surfaced in the bounded searches. Kordara already appears as a surname and place name; the similar Kordava is used by software businesses.	Preferred candidate for further checks, not cleared.
Aksen Labs / Aksen Operations	Existing Aksen-branded digital-commerce platform at aksen.in; current project investment provides continuity.	Retention option, but search distinction is weak.
Arksen	Established explorer-vessel and apparel business uses the name.	Drop from this shortlist.
Operlane / Relaystead	Existing businesses describe integration or operational handoff services.	Reject for this business.

Screening evidence: [Arksen About](#), [Aksen digital platform](#), [Operlane](#), [Relaystead](#), and [Kordava software](#). Undated live pages checked 4 September 2026. Exact and related-name searches also covered Kordara, Kordara Systems, Kordira, Tandrel, Roventra and alternatives; non-results are not proof of absence.

Selection sequence: buyer pronunciation/comprehension test -> ORC exact and similar-name search -> Ghana and relevant trademark-register checks -> domain and handle availability at the point of purchase -> founder selection -> update documents and public assets. ORC explicitly considers similarity in sound and appearance; WIPO says national and regional registers may also need checking. [ORC Reservations](#) and [WIPO Global Brand Database](#), checked 4 September 2026.

No registry filing, trademark clearance, domain-availability verification or purchase has occurred. Kordara's resemblance to Kordava must be part of the clearance check. Keep Aksen as the internal project label until a replacement is selected.

STRATEGY NOTE 05

Pricing grounded in local offers

The existing GHS 20,000-60,000 pilot range can remain a complex-engagement range. It should not be the only first step for a simple workflow. Local competitors publish a wide spread of scopes, so quote by defined work and economics rather than copying a price band.

Comparator	Publicly advertised pricing	What it tells us
BVM Digital	Audit GHS 1,500; Quick Win GHS 3,500-6,000; full stack GHS 12,000-25,000; support from GHS 2,500/month	A local consulting entry point exists below the current blueprint range.
Coriable	Website AI chatbot GHS 8,000-18,000; WhatsApp assistant GHS 15,000-40,000; workflow automation GHS 20,000-120,000	More complex implementation is advertised at higher fees.
AutomateGhana Kasabot	GHS 800, 1,000 or 1,500/month, advertised no setup fee	A vertical software subscription is an alternative to bespoke service, not an equivalent scope.

Sources: [BVM Digital pricing](#), [Coriable pricing](#), [AutomateGhana](#). Live pages checked 4 September 2026; update dates unspecified. These are vendor offers, not verified sales, service quality or market averages.

Proposed experiments, not validated market prices:

Offer	Initial test price	Scope limit
Workflow Assessment	GHS 2,500 fixed	One process, discovery session, sample review, baseline, workflow map and written implementation scope. No build.
One Workflow Pilot	GHS 9,000-12,000	One outcome and channel, up to two straightforward integrations, clean client data, human handoff, training and 30-day defect support.
Connected Workflow Build	GHS 18,000-30,000	A scoped sequence across enquiry, proposal or delivery; estimate after assessment.
Managed Operations	GHS 3,000/month starting test	One deployed workflow, business-hours incident triage, monitoring, monthly review, two planned improvement hours; total delivery budget initially eight hours/month.

Define business hours and acknowledgement target in each agreement; do not promise a resolution time before staffing it. New workflows, migration, custom integrations and expanded support are change requests. Separate taxes and third-party charges. Give a fixed quotation after scoping; the range is not permission for unlimited work.

STRATEGY NOTE 06

Price for delivery effort and recurring value

Illustrative economics only: use GHS 120/hour as a placeholder loaded delivery cost until actual costs are known. Founder time is a cost even when no salary is drawn. Contribution below excludes sales time, general overhead and tax; it is not take-home profit.

Scenario	Calculation	Contribution
GHS 9,000 pilot, controlled scope	36 total hours x GHS 120 + GHS 300 incidentals = GHS 4,620	GHS 4,380 / 48.7%
Same pilot with rework	60 hours x GHS 120 + GHS 300 = GHS 7,500	GHS 1,500 / 16.7%
GHS 3,000 monthly care	8 hours x GHS 120 + GHS 300 direct costs = GHS 1,260	GHS 1,740 / 58.0%
Same care with heavy support	20 hours x GHS 120 + GHS 300 = GHS 2,700	GHS 300 / 10.0%

Cost floor: estimated delivery cost / (1 - chosen contribution margin). At GHS 4,620 cost and a proposed 50% contribution target, the floor is GHS 9,240. The GHS 9,000 pilot is a controlled validation price slightly below that target; use GHS 9,500 or more if the same cost estimate must meet 50%. Decline or reduce scope when the buyer's value cannot support the floor.

Proposed terms: assessment paid upfront; pilot 50% deposit, 30% on acceptance testing and 20% at handover; care monthly in advance from the agreed start date. Defects in the agreed build remain covered by the defect period; care adds monitoring and improvement. Do not bill twice for the same obligation. Credits or discounts must be written and included in the margin calculation.

Customer value test: monthly gross benefit minus care and usage costs must be positive. If a GHS 12,000 setup produces a verified GHS 5,000/month gross benefit, with GHS 3,000 care and GHS 500 usage, simple payback is eight months. A proposed six-month screening target would reject or reshape that deal. These numbers illustrate the method only.

Use recovered gross profit rather than sales revenue. Time saved is released capacity until reduced expenditure or productive redeployment is demonstrated. Ask why ongoing care is needed: changing knowledge, integration failures, exceptions, staff changes and performance reviews can justify it; a stable one-off automation may only need occasional support.

STRATEGY NOTE 07

Technology costs and delivery boundaries

Keep client-owned business accounts and credentials wherever practical, with delegated access for implementation. This supports continuity at handover and makes external usage visible. Preserve the current Postgres and application investment where it passes verification; introduce a workflow tool only when it solves a specific integration need.

n8n lists Starter at EUR 20/month billed annually for 2,500 workflow executions, and Pro at EUR 50/month billed annually for 10,000. These imply EUR 240 and EUR 600 annual plan charges before applicable taxes, not monthly cancel-anytime commitments. Executions are workflow runs, not conversations. A five-minute schedule fires 8,640 times in a 30-day month. [n8n pricing; checked 4 September 2026](#).

n8n's official guidance says hosting client workflows and credentials in an agency's own instance requires Enterprise licensing. Consulting on client-owned internal instances does not require a commercial licence on the consultant's part; client requirements still apply. Get a vendor determination before adopting a pooled hosting model. [n8n licensing FAQ; checked 4 September 2026](#).

Meta distinguishes destination markets and message categories; service messages within the user-initiated 24-hour service window are free at Meta's layer. Exact Ghana paid-template rates were not verified. Twilio, as one possible provider, lists USD 0.005 per inbound or outbound WhatsApp message plus applicable Meta charges. An assumed 12,000 messages would therefore cost USD 60 in Twilio handling fees alone. [Meta platform pricing](#) and [Twilio WhatsApp pricing](#), checked 4 September 2026.

Before quoting usage: record channel volume, executions, tokens, selected model, retry allowance, storage, provider fees, exchange rate at billing, taxes and a spending cap. Keep USD/EUR inputs in their original currencies until an actual conversion quote is available. No universal per-client infrastructure budget is claimed here.

Verify model identifiers in the live provider catalogue and run representative tasks before deployment. The project's hard-coded model names are not proof of availability. Use a stable event log and small, replaceable tools; Anthropic's April 2026 architecture separates session history, model execution and tool environments. This is a design lesson, not a recommendation to buy its service. [Anthropic, Scaling Managed Agents; 8 April 2026](#).

STRATEGY NOTE 08

Run the company with its own method

Internal client zero: the founder's enquiry-to-proposal-to-delivery process. Define the manual process first, record a baseline, then introduce assistance. A company with little inbound volume should not manufacture activity to make an automation look useful.

Workflow	AI assistance	Rules and founder responsibility	Evidence
Prospect research	Summarize verified public business information and prepare a relevant brief	Record sources; founder selects fit and sends outreach	Qualified conversations per researched firm
Enquiry intake	Extract need, missing information and draft next step	Create one record; owner and due date required; founder approves reply	Missing fields, response time, duplicate rate
Discovery to proposal	Summarize notes, map process and draft scope	Founder verifies baseline, effort, price and terms before sending	Proposal preparation time and correction count
Deposit to delivery	Draft checklist, tasks and weekly status	Confirm payment from an authoritative record; approve scope and launch	Actual hours, acceptance results, delivery date
Support and review	Classify incidents and draft monthly results	Human handles commitments; review failures and costs	Incidents, recovery time, cost and renewal
Finance and knowledge	Categorize receipts and suggest knowledge updates	Reconcile accounts; approve tax treatment and factual changes	Unreconciled items and source freshness

These are proposed capabilities, not existing integrations. Initially a person can execute approved actions while the system records them. External outreach, proposals and publication remain founder-approved; no messages were sent during this research.

First internal workflow contract: trigger = submitted enquiry or manually entered prospect; required fields = source, company, contact basis, observed need, owner, next action and due date; steps = validate -> deduplicate -> save -> draft -> review -> act -> record outcome. On failure, retain the request, alert the owner and permit a safe retry. A request ID should prevent duplicate external actions.

Proposed internal acceptance gate: 30 labelled test cases covering missing data, duplicates, unclear requests, unauthorised actions and provider/database failures; no unauthorized sends; no lost accepted requests; duplicate attempts do not duplicate actions. Then run a 14-day internal pilot with every real case reviewed. Test fixtures prove behavior, not customer demand; report real-case counts separately.

The baseline and comparison should track manual minutes, corrections and completion, not just generated text. Anthropic's simpler-workflow guidance supports adding autonomy only when complexity improves measured results. [Building effective agents; 19 December 2024, current page notes newer tooling.](#)

STRATEGY NOTE 09

What to reuse and what to strengthen

The existing platform is an asset to refine. This was a targeted source-code review, not a penetration test, build verification or audit of deployed configuration.

Observation in current code	Business consequence	Next implementation step
Opportunity intake stores a record and an audit event	A useful foundation for the sales workflow exists	Add consistent owner, due date and measurable stage history
Conversation updates overwrite a summary; no message-event table appears in the reviewed schema	A summary alone cannot reconstruct the customer interaction	Store appropriately scoped events with agreed retention
Agent logging catches and suppresses database errors	A successful response can be missing from the operational record	Surface logging failures and queue durable writes for important events
Admin API routes check an email allowlist only when it is populated	An empty configuration can admit any authenticated user at these routes	Deny by default when authorization configuration is missing; test API access directly
Approval endpoint updates status and audit record	An approval screen alone does not guarantee controlled execution	Bind approval to exact action/version and execute once after permission checks
Model wrapper returns answer/model but no token-usage costs	Cost fields in the schema do not establish actual cost tracking	Capture actual provider usage, price version and cost; reconcile invoices

Source files reviewed: platform/db/schema.ts; lib/conversations.ts; lib/agent-runs.ts; lib/openrouter.ts; app/api/opportunities/route.ts; app/api/admin/approvals/route.ts; app/api/admin/projects/route.ts. These paths are relative to the Aksens-Labs project. No live vulnerability or actual data exposure is asserted; configuration and runtime behavior were not inspected.

Build order: access controls and event integrity -> one enquiry workflow -> proposal and delivery handoff -> support and cost review. Do not spend the first month expanding the gallery, generating more brand media or building a generalized client portal.

Keep billing and accounting in an appropriate existing system until a real integration need is known. Keep a knowledge register with source, owner, last verification date and permitted use. Use normal database rules for money and permissions. Introduce client tenancy only after explicit isolation, export, deletion and access tests.

Every reusable workflow should eventually contain its process map, configuration, allowed actions, example inputs, test set, failure procedure, time estimate and evidence of outcomes. That package is more defensible than the number of agents displayed on a website.

STRATEGY NOTE 10

Acquire evidence before scaling acquisition

Start from zero assumed warm prospects. Past paid work may provide experience or permissioned examples; the plan does not assume referrals, testimonials or client logos can be used.

First 30-day experiment: research 15 property agencies and 15 commercial cleaning/maintenance firms. Verify that each is operating, has a relevant channel and recurring workflow, and identify an appropriate public business contact. These are research targets; no actual list or outreach campaign has been executed here.

Seek 10 discovery conversations, then three proposals addressing observed problems and one paid pilot. This is a management target, not an assumed funnel conversion. Track researched -> contacted -> replied -> interviewed -> qualified -> proposed -> deposit paid. Capture dates, sources and loss reasons. Never count a demonstration or a friendly response as a sale.

Discovery script:

- Walk me through the last enquiry or job that became difficult. What happened next?
- How many similar cases occurred in the last month, and where are those records?
- Which steps require someone to chase information or re-enter it?
- How much time did those steps take? What errors or delays can we observe?
- Who owns the process, supplies approved information and signs off a change?
- What have you already tried or paid for? What would justify buying this now?
- Can we establish a baseline and test one narrow change with a fixed budget?

Suggested conversation opener: "I am researching how service businesses handle enquiries and move them into quotes or bookings. I would like to understand the last time that process became slow or messy. If there is a useful fit, I can propose a small, measured workflow project." This is a draft for the founder, not a message sent to anyone.

Choose the niche using paid commitment, data readiness, measurable value, delivery effort and reuse. After five interviews in a cohort, revise the problem statement if no repeated pain emerges. After three comparable proposals with no deposits, inspect fit, trust, value and scope before changing price. Small samples are directional; they do not establish market conversion rates.

Growth channels after proof: permissioned case study -> founder explanation of the workflow -> direct business introductions -> complementary website/IT/accounting partners. Paid advertising becomes a test only after the offer converts and delivery capacity exists. A successful internal process can demonstrate workmanship, but is not a substitute for independent client results.

STRATEGY NOTE 11

The 90-day execution plan

The dates below assume a start on 4 September 2026. They are sequencing targets, not commitments made on the founder's behalf. At roughly 25 hours/week, reserve about 35% for sales, administration and learning; run only one substantial pilot at a time initially. With less time, extend the calendar rather than weakening acceptance criteria.

Period	Founder and delivery work	Exit evidence
Days 1-7 / Sep 4-10	Confirm weekly hours, spending cap, legal status and past-work evidence. Adopt draft profile; test naming candidate. Map internal enquiry flow and baseline manual work.	One offer brief, business/input register and baseline plan
Days 8-14 / Sep 11-17	Strengthen access/event controls; implement one internal assisted flow. Prepare discovery script, cost model and demo walkthrough. Start prospect research.	Test results, reviewed internal workflow and first verified prospects
Days 15-30 / Sep 18-Oct 3	Run internal pilot; conduct interviews and draft scoped proposals. Seek first deposit. Complete relevant setup and data-processing obligations.	Target: 10 conversations, 3 proposals, 1 paid pilot; document actual counts
Days 31-60 / Oct 4-Nov 2	Deliver one client pilot with baseline, testing, training and handover. Log every delivery/support hour and invoice. Offer care before pilot close.	Acceptance evidence, contribution calculation and paid care decision
Days 61-90 / Nov 3-Dec 2	Repeat the same workflow at a second client if capacity allows; improve reusable package; publish a permissioned case study.	Target: 1-2 completed pilots, at least 1 care client; stop/revise/expand decision

Weekly operating review: pipeline next actions; cash collected and unpaid invoices; delivery hours versus estimate; failing workflows and unresolved incidents; actual provider spend; client outcomes; one decision and its evidence. AI can prepare the review, but the founder owns its conclusions.

Spend discipline: no budget was supplied, so this report does not allocate cash as if approved. Use existing tools first, client-owned usage accounts, and deposits before significant delivery costs. Set a specific discretionary monthly cap before new subscriptions. Account separately for mandatory registration, professional advice, connectivity, travel, equipment and founder living costs. These have not been priced or assumed free.

Day-90 decision: expand only if the workflow produces accepted outcomes, contribution remains acceptable after logged delivery time, and a buyer pays for ongoing care. If not, revise the segment, scope or service model. A one-off implementation business can be valid even when recurring care is not yet justified.

STRATEGY NOTE 12

Growth potential with capacity constraints

The sensible sequence is one useful workflow -> repeat it for similar clients -> maintain it profitably -> add adjacent workflows -> productize common requirements. Ghana is the learning market; expansion to diaspora clients or other countries should follow demand and delivery readiness, not an unsupported continental growth projection.

Illustrative first-year scenarios, not forecasts. Fees exclude tax and separately billed external usage. Implementation revenue assumes the projects are delivered; recurring revenue counts active client-months, not year-end MRR multiplied by 12. Discovery revenue is excluded to avoid assuming extra sales or double-counting credits. Cash collection, churn and overhead could change the outcome materially.

Scenario	Delivered implementations	Active care months	Year-end care clients	Annual fee revenue	Exit MRR
Cautious	4 x GHS 9,000	18 x GHS 2,500	3	GHS 81,000	GHS 7,500
Working case	8 x GHS 12,000	36 x GHS 3,000	6	GHS 204,000	GHS 18,000
Expansion	12 x GHS 18,000	60 x GHS 4,000	10	GHS 456,000	GHS 40,000

These client-month totals assume gradual acquisition, roughly six paid care months per eventual year-end care client and no churn in the illustration. Attach rates are high assumptions, not demonstrated probabilities. Actual start dates, cancellations and renewals must replace them.

Capacity check: the working case assumes 45 hours per implementation and eight support hours per active client-month: $8 \times 45 + 36 \times 8 = 648$ delivery hours/year. At 25 hours/week for 46 weeks, with 35% reserved for non-delivery work, 747.5 hours remain. That leaves about 100 hours of buffer; peak monthly demand could still exceed capacity. At 15 hours/week, only 448.5 delivery hours remain, so this case does not fit.

The expansion case assumes 60 hours/build and 10 hours/client-month, requiring 1,320 hours. Even 40 hours/week over 46 weeks leaves only 1,196 delivery hours after the same reserve. It needs trained help, lower measured effort or slower growth. Revenue is not profit; include founder sales time and overhead before deciding whether to hire.

Proposed expansion gates: three similar paid deployments; clear buyer outcome; two actual care renewals; contribution target met with real hours; documented incident and handover procedures. Only then test another workflow, delivery partner or market. No numeric valuation, market share or funding outcome is implied.

STRATEGY NOTE 13

Launch obligations and decisions still open

Business setup: confirm the legal structure, registered activities, name approval, banking and invoicing identity. ORC requires a name search; the registrar decides acceptability. Some older ORC web fees conflict with a newer 2026 schedule, so registration fees are not quoted here. [ORC Business Registration](#) and [ORC 2026 fees](#), checked 4 September 2026.

Tax setup: current GRA guidance treats service registration differently from the GHS 750,000 goods threshold. Section 7.1 says service providers have no registration threshold, subject to the Commissioner-General's direction, and states a 30-day registration rule. Confirm how this applies to the founder's existing activity and proposed entity with GRA or an accountant before issuing the new invoices. Do not assume small turnover means exemption. [GRA guidelines for Act 1151; official indexed PDF, January 2026 upload](#).

Client information: assess controller/processor roles and complete applicable DPC registration before processing client personal data. Define authorized sources, access, retention, deletion, vendors and incident contacts. The DPC registration page was under maintenance during direct verification; official indexed guidance was available. [DPC registration](#) and [DPC compliance](#), checked 4 September 2026.

Delivery agreement: define the exact job, client inputs, permitted actions, acceptance owner, payment milestones, changes, defect support, care allowance and exit/export procedure. No binding prices, payments, public messages or customer commitments should be generated and executed without the agreed authority.

Decisions for the next working session: weekly founder hours and cash cap; whether to test Kordara Systems; which past projects can support a permissioned proof story; first interview cohort; actual labor cost; and a specific internal enquiry workflow owner. The recommended first build is the internal flow in section 08, after checking the foundation in section 09.

Research limits: no customer interviews, test purchases, audited competitor results, registry clearance or live deployment validation were performed. Some official Ghana pages were accessible only through indexed excerpts. Exact WhatsApp Ghana template rates, domain availability, model configuration and launch fees remain quote-time or verification inputs. Public offers and provider terms were checked on 4 September 2026 and should be rechecked before purchases or quotations. Historical statistics retain their stated reference years.

This desk-research phase stops because the remaining high-impact uncertainties require founder facts, customer evidence, formal name checks and measured delivery. More general AI market statistics would not resolve them.
